My project name is **GenTuTor – A Syllabus-Based AI Teaching Assistant**.

This system is designed to help students learn easily using their **university syllabus and textbooks**. Students just need to **upload their syllabus**, and the system will automatically generate:

- **Exam tips**
- **Notes**
- **Simple explanations** for each topic

One of the main features is the **Q&A chatbot**. Students can type their doubts, and the system will give answers related to the topic.

Another important feature is the **quiz section**, which helps students test their knowledge after each topic.

There is also an **admin panel**, where the admin can **monitor student performance**. Based on how much the student is using the app, the system will show **visual reports** like charts and graphs to understand their progress.
